

Dynaudio Xeo 2 2.03 Release Notes

This release includes updates on usability, as well as bugfixes. Note that if using Xeo 2 together with a Connect, you must also update the Connect to the latest version, for the best possible experience.

Changes in this firmware release:

Startup sequence

The behaviour of the startup sequence after power-off is changed significantly: The speaker will now start up with local input as the default, and only search for a Hub/Connect if you select the Channel ID of a Hub/Connect on the remote. Previously the speaker would perform a 40 second environment scan at startup – this is no longer needed, significantly improving the startup time.

LED Behaviour

To improve the usability and the consistency across Xeo and Focus XD, the color scheme of the LED signalling has been changed. With this release, the LED will light Blue whenever the speaker is playing from a Hub/Connect source. The LED will light Purple whenever the speaker is playing from a local source connected to the Master speaker.

Bugfixes

This release includes several bugfixes related to stability, autosense behaviour, Bluetooth and input switching.

The release also includes all features of previous firmware releases.

Previous releases introduced the following:

Autosense Disable feature

Night Mode

Fixed Volume Mode

Bugfixes
